

## Polyester kit

### Model Z

This model is made of 2 mm thick fiberglass reinforced polyester sheets. Internally it is reinforced with vertical steel omegas.

Thanks to the self-manufacture of polyester, the body can be painted, during its manufacturing process, with almost any colour.

The two-piece profiling system allows a simple and quick assembly of the kit, free of rivets and visible exterior sealing.

### Model ZR

It is based on the Z model, being manufactured in 3.5 mm thick fiberglass reinforced polyester sheets. Internally it is reinforced with vertical steel omegas.

The technical manufacturing characteristics of this model are like those of the Z model. However, as it is manufactured with a greater thickness, the polyester is considered to be reinforced and, therefore, its resistance and durability increase.
